# Cloud Computing Paradigm

- ▷ Vast majority of new technologies base their operations on **Cloud**
- ▷ 2010 → 2018: Compute instances increased by **550%** and IP traffic by **1,000%**
- ▷ 2018: Cloud Global Energy Use of **205 TWh** (1% of Global Energy Consumption)

# Cloud Computing Paradigm

- ▷ **Progress on Data Center energy efficiency**
  - Global Power Usage Effectiveness (PUE) of 1.67 (ideal = 1)
  - Energy use per computation has dropped ~400%
- ▷ **How much longer can we improve energy efficiency?**
  - **Cooling energy** expenses represent, on average, up to **40%** of the total bill
  - In the next **3 or 4 years** the number of compute instances will **double** again

# Cloud Computing Paradigm

- ▷ Progress on Data Center **energy efficiency**
  - Global Power Usage Effectiveness (PUE) of 1.67 (ideal = 1)
  - Energy use per computation has dropped ~400%
- ▷ How much longer can we improve energy efficiency?
  - **Cooling energy** expenses represent, on average, up to **40%** of the total bill
  - In the next **3 or 4 years** the number of compute instances will **double** again

**We urgently need better optimization in Data Centers!**

## Data-Driven Optimization

- ▷ Outstanding results of **Machine Learning** and **Deep Learning**. Why?
  - Massive amounts of data
  - Increased computing power (GPUs)
  - Transfer learning from expert pre-trained models
- ▷ ML and DL optimization in Data Centers
  - Systems incredibly challenging to optimize
  - Google achieved 40% of cooling energy saving (15% reduction of PUE)

Source: DeepMind

# State Of the Art: Synthetic Time-Series Data

## Generation Based on Statistical Methods:

- ▷ Naive: Gaussian Noise, Rotation, Scaling, Warping...
- ▷ AutoRegressive Models: ARIMA, ARMA...
- ▷ Markov Models: Hidden Markov Models
- ▷ Bayesian Models: Dynamic Bayesian Networks, Bayesian Structural Time-Series...

### PROS

- ❑ Interpretability
- ❑ Can be applied in small datasets

### CONS

- ❑ Require expertise knowledge
- ❑ Poor work on multivariate data with non-linear relationships
- ❑ Do not always improve with more data

# State Of the Art: Synthetic Time-Series Data

## Generation Based on GANs:

### PROS

- ❑ Outstanding empirical results
- ❑ Can handle multi-variable data with non-linear relationships
- ❑ Flexible tune generation
- ❑ Can be applied in conjunction with traditional data augmentation methods

### CONS

- ❑ Unstable training (partially solved)
- ❑ Diversity of the generated data can be limited and biased by the available data
- ❑ It needs relatively large amounts of data for efficient training
- ❑ It does not compute an explicit density estimation (i.e., black-box model)

# Conclusions

The results obtained in this work establish a methodology that extends **synthetic time-series data** applications, enabling to use **categorical variables** and **multi-variable scenario generation**.

**On-demand anomaly generation** introduces significant data **variability** without additional effort or endangering electronic equipment integrity.

The proposed methodology can be employed in any similar time-series-like problems in **other fields of application**.

Our research will help to **apply synthetic data generation to different real-world time-series** problems. Through the proposed use case, enabling **better optimization of Data Centers**, and thus, **a more sustainable and greener future**.

# Open Issues

- ▶ **Scarce Research on Time-Series GANs**

Leads to unstable training and the need for intensive hyperparameter search.

- ▶ **Generated Data Bias**

Generated data variability is limited and biased by the available data.

We also need better metrics to measure “realism”.

- ▶ **Human Supervision is Needed**

The fact that the training process is not perfect and the accessible data is limited, implies that some generated samples do not correspond to real situations.

- ▶ **Relatively Large Amounts of Data are Needed**

GANs require “large” amounts of data for stable training. Still, this amount is tiny compared to that needed to achieve state-of-the-art results in Deep Learning models

# Future Work

## Hyperparameter Optimization

**Analyze Scalability of  
Multi-Variables Datasets**

**Further Study on the Usefulness  
of the Results**

E.g., Train on Synthetic, Test on Real

**Disentangled Latent Space**

[54]

**Add Supplementary  
Conditional Information**

E.g., Freq., ARIMA, Time Information...

**Explore Alternatives  
Evaluation Metrics**

E.g., Divergence of Freq. Spectrum

**Explore Further GAN  
Architectures and Improvements**

E.g., StyleGAN, Model Weight Averaging...

Thanks!

**Any questions?**
